NORMALIZER FIX MANUAL TEST

Purpose

This small manual test covers the two normalizer fixes made on 2026-11-05: preserving inline formatting around complex math in table cells, and rolling back partial cleanup state when an unsupported input causes mixed-input fallback.

Run from the folder containing compile.bat.

1. Table formatting test

Compile this file by itself:

```
.\compile.bat ".\documentation\NORMALIZER_FIX_MANUAL_TEST.txt"
```

Inspect the PDF table and console output.

Before the fix, nested formatting around complex table math could cause XeLaTeX errors, including "Forbidden control sequence … nocorr@". The affected cell's text before the math could also disappear from the output.

After the fix, the build should complete without a LaTeX error for this table. The PDF should show **Bold *emphasis before*** and **and after remains bold** in bold, with the matrix rendered between them as math, outside the formatting spans: $\begin{matrix} a & b \\ c & d \end{matrix}$.

Case	Expected rendering
Nested bold and emphasis around matrix math	**Bold *emphasis before*** $\begin{matrix} a & b \\ c & d \end{matrix}$ **and after remains bold**

2. Mixed-input fallback test

Compile this file with compile.bat as the second input. Its .bat extension is intentionally unsupported by the normalizer's text-cleaning stage and triggers the original-Pandoc-parse fallback:

```
.\compile.bat ".\documentation\NORMALIZER_FIX_MANUAL_TEST.txt" ".\compile.bat"
```

The compiler will also include compile.bat as input content in the resulting PDF; that is expected for this fallback test.

Before the fix, cleanup state gathered from this .txt file could leak into finalization even though the original Pandoc parse was retained. For example, the console could report removed citation-marker characters while the markers were still present in the PDF.

After the fix, the PDF should retain both citation markers below, and the console should not report that citation-marker characters were removed.

Fallback marker one: FALLBACK_STATE_ALPHA

Fallback marker two: FALLBACK_STATE_BETA

Expected output summary

Before the fix:

- The nested table case could report a LaTeX error or lose formatted text.
- Mixed-input fallback could report cleanup performed only on its abandoned cleaned-input path.

After the fix:

- The table builds without a LaTeX error and keeps the surrounding text formatting.
- Mixed-input fallback keeps the citation-marker source text and does not report partial cleanup from the abandoned path.
