Reference Notes

Made By Abhik Biswas

Yes. In fact, that is exactly how `\renewcommand` is meant to be used.

Once a command has been brought into existence—whether by the LaTeX core, a package you loaded, or your own `\newcommand`—you can use `\renewcommand` to overwrite it at any point in the document.

Example Sequence

Hello World!

\newpage

% If you type \mygreeting here, it outputs: Hello World!

[!!!] \renewcommand {\mygreeting }{Welcome to the new chapter!}

\newcommand{\mygreeting}{Hello World!} \mygreeting \renewcommand{\mygreeting}{Welcome to the new chapter!} \mygreeting

The Scoping Rule

Where you place the `\renewcommand` determines how long the change lasts:

- **In the preamble or main body:** The command is permanently changed from that line forward.
- **Inside an environment or group:** If you use `\renewcommand` inside an environment (like `\begin{minipage}...\end{minipage}`) or inside curly braces (`{ ... }`), the overwrite is temporary. The moment that environment or group ends, the command automatically reverts to its original `\newcommand` definition.
